

How does MPAC assess my residential property?

At MPAC, we know understanding your property assessment is important to you – and we are here to help. Please review the information below to better understand how we assess your **residential** property. You can also visit mpac.ca and log into **MPAC AboutMyProperty™** to learn more about how your property was assessed and how its value compares to similar properties in your area.

How your residential property is assessed

To assess your residential property, we compare the details of your property to similar ones that have sold in your area.

While over **200 factors** are considered when assessing a property, there are **five factors** that generally account for the majority of your home's value:

Age of buildings

Exterior square footage

Location of the property

Lot dimensions

Quality of construction

Newly built homes

When your home is built, the building permit process may prompt an MPAC property inspector to visit your property and confirm the details.

After you move in, you'll receive a **Property Assessment Change Notice** acknowledging that the house was built, your property details, and the assessed value.

Waterfront homes

If your property has direct access to a natural or man-made waterway, or if you're separated from it by a right-of-way, private road or unopened road, you have a waterfront home.

For waterfront homes, the body of water your property is adjacent to or located on, and the amount of water frontage are important, in addition to several other factors, including:

Seasonal / Water access

Shoreline type

Topography

Island vs. Mainland

Predominant exposure
